2.40 (b) (2) REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

A female Yorkshire terrier Cinnamon id#0A01497841 had areas on her muzzle around her tail and on her rear legs that had matted hair balls. Matted hair on the dog can cause discomfort & could lead to infection or health problems for that dog. Mobility of the dog could also be affected with the discomfort or pain associated with matted hair constantly pulling on the skin of the dog. The potential for the skin to become inflamed or infected exists with continued scratching. Matted hair does not maintain the same insulating qualities of normally groomed hair. Regular grooming of matted hair is necessary to ensure the health & well being of all dogs. Licensee representative advised the matted hair would be removed as completion of inspection.

A female Shar Pei Tiger Lilly id# 0A01497841 had toenails that needed trimming. The toenails were beginning to curl back into the pad, affecting the dog's normal posture. Long toenails can affect the mobility of the dogs and can cause discomfort. During the inspection there were other dogs that had toenails that needed trimming. Licensee must ensure that all the dogs toenails are routinely maintained. Licensee representative advised that the toenails would be trimmed after completion of inspection.

Inspection and exit interview conducted with Licensee.

2.40 (b) (2)

DIRECT NCI

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

***An adult female fawn and white English Bulldog identification number 103519068 has a swollen lesion between digits four and five on her left front foot. It is oblong in shape, reddened, moist-looking, hairless and approximately the size of a pea.

***An adult female red and white English Bulldog identification number 4A5A05733A has a large swelling on her right front paw between digits four and five. It is round in shape, mostly hairless, approximately the size of a marble, and can easily be seen even while the dog has her foot down on the ground. In addition, the white part of her right eye is very red and inflamed.

***An adult female red and white English Bulldog identification number 4A395D57 has a lesion between digits four and five on her left front foot. It is pink, oblong in shape, mostly hairless, and approximately the size of a large pea. The lesion was draining a clear pink colored fluid. These lesion can be painful causing discomfort and it could potentially affect the mobility and daily activity of the dog.

***An adult female red and white Pekingese identification number 49072E666A has a right eye that has a thick, greyish-yellow discharge covering approximately 20% of the surface. Approximately half of the iris has a milky-white, thickened opaque area. In the center of this opaque area, there is a small gray dot, and it appears to be slightly sunken in. Eye disease can be caused by a variety of problems including infection, allergies, injury, irritation or other medical conditions and can be painful and distressing. Not having clear vision can cause discomfort affecting the health and well being of the dog. The potential for injury exists if the dog is not able to clearly see.

The licensee must have this animal examined by a veterinarian and appropriate treatment plan administrated. The outcome of this examination must be documented and provided to the inspector upon request. The licensee must ensure that all animals receive adequate veterinary care at all times.

Nick a gray and white Male Poodle id#OAO1675437 had a buildup of brown and creamy white substance between the gum and the top of the top of his back teeth. The gums appeared red and inflamed and contained a spot of reddish material on them between the tooth and the gum line. The gum line was reddened along the top of the tooth and appeared rope like all along the top of the teeth from the front to the back.

Red, Swollen lesions between digits
• large swelling on right front paw
• lesions between toes
• thick gray/yellow discharge in eye
iris - milky white-opaque
• brown creamy white substance between gum & teeth
gums have reddened

Inspection Report

Rasie a red female poodle id# 4859526616 had a buildup of brownish matter on her teeth. The gum appeared reddened and swollen, along the top of the teeth the gum appeared rope like, swollen and reddened. The dog flinched when inspectors tried to lift the dogs lips to get photos of the teeth and gum area.

Brownish matter on teeth

Gum disease and buildup of brown substances can cause pain and discomfort for the dogs. Swollen gums and creamy white discharge can be indicative of gum disease or other health problems that could adversely affect the health and well-being of the dogs. Owner must ensure that all dogs are routinely checked and treated for dental problems. Owner must have animal evaluated by a licensed veterinarian and maintain a record of the evaluation and treatment protocol. To be corrected by 09-21-2014.

3.1 (a)

HOUSING FACILITIES, GENERAL.

In the female bulldog barn building, the sheet metal siding along the cement floor has rusted to the point it is no longer structurally sound and rusted to the point that it is creating sharp points that could injure the dogs. The male barn also has areas of sheet metal that are rusted or deteriorated to the point that it is no longer structurally sound and creating sharp points. A gate frame in the outdoor kennel area is rusted to the point that it is no longer structurally sound and created sharp points that could injure the dogs. Injuries from rusted metal can be painful and uncomfortable for the dogs. Owner must ensure that all metal used on the buildings and around the dogs is free from rust, corrosion, is structurally sound and protects the dogs from injury. To be corrected by 09-25-2014.

Housing
• sheet metal rusted NOT structurally sound sharp points

The female building and the male building had areas of concrete floor of the building where the concrete had cracked creating holes where dirt, old food and other debris has accumulated. These cracks in the concrete can harbor harmful bacteria and other vermin that could adversely affect the health and well-being of the dogs. The cracks must be repaired so the floor is impervious to moisture and easily cleaned and sanitized. All debris must be removed from the cracked concrete and the area repaired or replaced so that it can be easily cleaned and sanitized. Licensee must ensure that all the surfaces the dogs come in contact with are impervious to moisture, free of cracks, and easily cleaned and sanitized. To be corrected by 10-02-2014.

Cracked concrete trapping dirt, debris, old food

In the whelping building one enclosure had a plastic Rubbermaid lid covering the dog door opening. The plastic was chewed around the base and part of the frame was broken. The chewed edges cannot be adequately cleaned and sanitized. The dog door openings on the male barn were covered with a cloth type material that was torn and tattered. The strains of material around the torn edges could be ingested by the dogs. The material had a dark brown substance buildup on them. The cloth like material must be impervious to moisture so it can be easily cleaned and sanitized.

There were several shelters in the outdoor section that had areas that were chewed, usually around the openings and along joints where the shelter are fastened together. The chewed areas cannot be adequately cleaned and sanitized and must be repaired or replaced so they can be adequately cleaned.

• chewed rubbermaid lid used to cover dog door

Inspection Report

sanitized and routinely maintained. Several shelter appeared dusty and stained. All the surfaces in contact with the dogs must be routinely maintained so they can be easily cleaned and sanitized.

3.1 (c) (3)

HOUSING FACILITIES, GENERAL.

There were at least seven dog doors that had a buildup of grease and grime on them. The door must be routinely maintained to prevent the buildup. The areas can harbor bacteria or other vermin that could adversely affect the health and well-being of the dogs. Owner must ensure that all the dog doors are routinely cleaned and sanitized. To be corrected by 09-21-2014

3.4 (b)

OUTDOOR HOUSING FACILITIES.

They were several enclosures, at least four that were equipped with shelters that were not large enough for all the dogs. One enclosure with 2 Rhodesian Ridgeback s measuring 40 inches and 38 inches in a shelter that was 38 inches wide and 45 inches wide and 30 inches tall. When both dogs are in the shelter neither have enough room to allow normal posture positions in the shelter. There were other enclosures containing three or more in an enclosure with one shelter. A Pomeranian and two Pekinese were in one enclosure. Three Pekinese were in one enclosure with one shelter. The shelter must be large enough so all the dogs have enough room to sit stand and lie in a normal manner. When the dogs are not allowed adequate space or additional shelters in a group enclosure, fights and territorial disputes can flare up causing injuries and undo stress for the dogs. Licensee must provide adequate space for each of the animals in all enclosures. To be corrected by 09-24-2014

3.11 (d)

CLEANING, SANITIZATION, HOUSEKEEPING, AND PEST CONTROL.

The area in the back of the male building, next to outdoor enclosures had a buildup of leaves and other matter. The debris pile was along the edge of the concrete slab, consisting of feces, old food and other debris. Several flies were observed around the pile of debris, landing on the old food and fecal matter. During the inspection licensee advised inspectors that one female Shar pie mix dog had problems with flies during the summer. The female Shar pie s ears were missing hair and scabbed over from old fly bites. The licensee must establish some means of fly control in this area of the facility. The fly strike can cause the dogs discomfort and wounds that can be painful. Licensee must ensure that all the dogs are adequately protected from flies and other vermin. To be corrected by 09-21-2014.

Inspection conducted with facility representative.

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

***In the sheltered facility, there was an adult female Bichon identified as #00-0723-CAB2. This dog was putting full weight on all four limbs, yet the left hind paw had a dime size, reddish blue raised area in between the second and third digits. Lumps can indicate a serious condition and can be painful or cause discomfort to the animal. The licensee must have this dog evaluated by a licensed veterinarian to obtain a diagnosis and appropriate treatment plan. The treatment plan must be followed. The licensee must ensure that all animals receive adequate veterinary care at all times.

To be corrected by August 11, 2015.

2.40 (b)

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

The kennel facility consists of two sheltered buildings and one indoor housing building (whelping building) which houses mothers and puppies. In the whelping building there is one two year old female Yorkshire terrier, chip # 019317089, named Angel Fire. The animal had a splint and bandaged right front leg. The dealer stated the animal had injured its leg approximately two weeks prior with a reevaluation appointment in two days. The dealer did not have any written documentation of the animal being injured or being evaluated by the attending veterinarian. In building #2 there is a two year old female Yorkshire terrier, chip #004327043, named Lady Mist. The animal's left eye is an orb of pink tissue. The dealer stated the animal's eye was a birth defect. The dealer also stated the animal had been evaluated by the attending veterinarian. However the dealer did not have any written documentation of the evaluation or treatment. Both animals must be evaluated by the attending veterinarian and the dealer must maintain written documentation of the evaluation and all treatment to protect the health and welfare of the animals.

Affects two adults.

Correct by June 12, 2015

3.1 (c) (1) (i)

HOUSING FACILITIES, GENERAL.

In sheltered building #2 there are four enclosures whose expanded metal type doors have excessively rusted surfaces which are rough and pitted. The doors need to be repaired or replaced to insure they can be properly cleaned and sanitized. Surfaces of housing facilities--including houses, dens, and other furniture-type fixtures and objects within the facility--must be constructed in a manner and made of materials that allow them to be readily cleaned and sanitized, or removed or replaced when worn or soiled. Interior surfaces and any surfaces that come in contact with the dogs must be free of excessive rust that prevents required cleaning and sanitization, or that affects the structural strength of the surface.

Affects four adults.

Correct by 24 June 2015

Animal w/ splint on injured leg - No documentation of any vet care provided.
animal's left eye an orb of pink tissue No documentation of any vet care provided

Excessive rusted surfaces of enclosure doors.

3.4 (b)

OUTDOOR HOUSING FACILITIES.

Shelter from the elements.

An adult male German Shepherd identified by microchip (075-880-845) was acquired by the licensee approximately two weeks ago. The dog is being kept in an outdoor enclosure that does not include a shelter structure. The enclosure has sheet metal on the roof and along the north and south sides. The east and west sides are constructed out of coated wire. The licensee stated that the pen is only used when quarantining new dogs. The licensee also stated the dog will be moved to the sheltered housing area when the test results are available and there are no health concerns.

Not having access to sheltered housing that will provide protection from direct effects of wind and rain can be stressful causing discomfort for the dog. The licensee must include one or more shelter structures that are accessible and that are large enough to allow the animal in the shelter structure to sit, stand, and lie in a normal manner, and to turn about freely. Shelters in outdoor facilities for dogs must contain a roof, four sides, and a floor, and must provide the dogs with adequate protection and shelter from the cold, heat, wind, rain, snow and direct rays of the sun.

To be corrected by: July 27, 2015.

3.1 (c) (3) REPEAT
HOUSING FACILITIES, GENERAL.

Cleaning.

Twenty-six outdoor runs connected to the shelter buildings have an accumulation of feces and urine frozen to the cement affecting 83 dogs. At least nine runs have the fencing wrapped in a plastic tarp material to help block wind. The runs covered in tarps do not make the surfaces the dogs come into contact with easily accessible in order to clean properly. As a result the licensee stated the runs are cleaned about once every two weeks and the runs not covered in tarps more frequently. The runs must be spot cleaned daily and sanitized at least every two weeks to reduce disease hazards and odors. When weather permits the licensee must clean and sanitize the outdoor runs connected to the shelter buildings.

Exit interview conducted with licensee.

2.40 (b) (2) REPEAT

ATTENDING VETERINARIAN AND ADEQUATE VETERINARY CARE (DEALERS AND EXHIBITORS).

A Persian kitten (Y-021) had a buildup of fecal matter caked on its rear end. After the inspectors pointed this out, the licensee immediately took the kitten to the sink and washed the kitten's hind end. After the fecal material was removed by the licensee, inspectors noticed the kitten's anal area was reddened and inflamed. This inflamed area could indicate infection or other veterinary medical condition which could be painful. The licensee must consult with a licensed veterinarian regarding this animal's condition in order to obtain an accurate diagnosis and to ensure that an appropriate treatment plan is developed and followed. The licensee must ensure that all animals receive adequate veterinary care at all times.

Date: Aug-26-2014

3.1 (c) (3)

HOUSING FACILITIES, GENERAL.

(c) Surfaces-- (3) Cleaning.

***In the puppy room there was an enclosure that had contained nine puppies. The puppies had been moved to other enclosures for cleaning and were to be moved back as soon as the floor dried according to the facility representative. In the Bio room, there was a puppy box that contained nine puppies. The walls and portions of the gate in the puppy room and the walls of the puppy box in the Bio room had a build up of dirty oil. There were at least two housing units in the outdoor enclosures that had a build up of dust and/or urine. According to the facility representative, the surfaces are cleaned every two weeks. Cleaning of hard surfaces is essential for a healthy environment and reduces disease hazards by eliminating harboring places for diseases and pests. The licensee must assure that all hard surfaces with which the dogs come in contact are spot cleaned daily and sanitized in accordance with Sec. 3.11(b) of this subpart to prevent accumulation of build up and reduce disease hazards.

To be corrected by August 31, 2014.

• Buildup of dirty oil, dust, urine in the puppy enclosure

3.6 (a) (2) (i)

PRIMARY ENCLOSURES.

Sec. 3.6 Primary enclosures

(a) General requirements.

(2) Primary enclosures must:

(i) Have no sharp points or edges that could injure the dogs.

***In the puppy room, the interior of the gate to an enclosure that had contained nine puppies which had been moved for cleaning purposes, had a piece of plywood that had chewed areas from the top to the bottom on the right side. In the outdoor facility, There was a piece of solid wall covering in an enclosure with one adult dog that had been chewed. Both of these chewed surfaces created edges that could injure animals that are placed into these enclosures. The licensee must remove the sharp edges and assure that there are no sharp points or edges in the primary enclosures as required.

To be corrected by August 31, 2014.

Chewed enclosures creating edges that could injure animals.
